

CODEALPHA PYTHON INTERNSHIP

TASK 2 — Stock Portfolio Tracker

Objective: Build a simple stock tracker that calculates total investment using manually defined stock prices.

Python Code

```
stock_prices = {
    "AAPL": 180,
    "TSLA": 250,
    "GOOGL": 150,
    "MSFT": 420,
    "AMZN": 180
}

print("===== STOCK PORTFOLIO TRACKER =====")

portfolio = {}
total_investment = 0

while True:
    stock = input("\nEnter stock name (or type 'done' to finish): ").upper()

    if stock == "DONE":
        break

    if stock not in stock_prices:
        print("Stock not available.")
        print("Available stocks:", ", ".join(stock_prices.keys()))
        continue

    quantity = int(input("Enter quantity: "))

    investment = stock_prices[stock] * quantity
    portfolio[stock] = quantity
    total_investment += investment

    print("Investment for", stock, "=", investment)

print("\n===== PORTFOLIO SUMMARY =====")

for stock, quantity in portfolio.items():
    investment = stock_prices[stock] * quantity
    print(stock, ":", quantity, "shares =", investment)

print("\nTotal Investment =", total_investment)
```

Sample Output

```
===== PORTFOLIO SUMMARY =====
AAPL : 5 shares = 900
TSLA : 2 shares = 500

Total Investment = 1400
```
